```
The patent discloses the use of novel apoptotic proteins and related condecides involved in apoptosis modulation. Expression vectors comprising the Apop DNA can be used to transform best cells. Apop DNA can be used to transform best cells. Apop DNA can be seministered as DNA vaccines. Apop proteins are used to make polycional and monoclonal antibodies for use in immunotherapy. The proteins are useful in treating apoptosis-mediated disorders including concer, autoimmune disorders, sustained viral infection, inappropriate cell loss and degenerative disorders. Drug candidates that affect Apop bioactivity are identified by screening. The present sequence encodes Apop3 protein. This was identified using RIP (receptor-interacting protein) as the bait protein employing the yeast two-hybrid screening system. Human Apop3 is expressed in heart, liver, pancreas, placenta, and lung. Overexpression of Apop3 inhibits TNF (tumour necrosis factor) calpha-induced caspase activation without affecting TNFalpha-induced C NFkappa B activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 100.0%; Score 1557; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                               The kinase of death (ROD) polypeptide is integral to the activation process of cellular apoptosis (programmed cell death). Apoptosis is needed to orchestrate biological maintenance of an organism during development as well as to preserve the normal function and fitness of tissues during a normal life span, physiological conditions which result from aberrant apoptosis may be dire. Cancer and autoimmune disease may result when there is too little apoptosis as well as severe stroke damage or the neurodegeneration of Alzhaimer's disease when there is too much apoptosis. The ROD polypeptide is useful for studying pathophysiological disorders related to apoptosis as well as for identifying compounds that modulate biological and/or pharmacological activity of the native mediator of apoptosis.
                                                                                                                                                                                                                                                                                                                         New nucleic acids encoding preventing, diagnosing and related to apoptosis

                 The invention relates to human protein activator of apoptosis and methods to identify compounds that modulate the biological and/or pharmacological activity of the activator and hence regulate apoptosis. The nucleic acid and amino acid sequences of the kinase of death (ROD) are useful for identifying compounds that modulate the biological and/or pharmacological activity of a native mediator of apoptosis, for treating dysfunctional apoptosis conditions in screening assays to identify agonists which agonise or mimic biological and/or pharmacological activity, induce production of or prolong the biological half-life of the molecule in vivo or in vitro. The present DNA sequence is the coding region of human KOD protein activator of apoptosis.

```
The invention relates to primers for synthesising full length cDNA clones, 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification; but was obtained in CD-ROM format directly from EPO.

Apoptosis is needed to orchestrate biological maintenance of an organism during development as well as to preserve the normal function and fitness of tissues during a normal life span. Physiological conditions which result from aberrant apoptosis may be dire. Cancer and autoimmune disease may result when there is too little apoptosis as well as severe stroke damage or the neurodegeneration of Alzheimer's disease when there is too much apoptosis. The KOD polypeptide is useful for studying pathophysiological disorders related to apoptosis as well as as for identifying compounds that modulate biological and/or pharmacological activity of the native mediator of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim

                                                                                                                                                                                                The invention relates to human protein activator of apoptosis and methods to identify compounds that modulate the biological and/or pharmacological activity of the activator and hence regulate apoptosis. The nucleic acid and amino acid sequences of the kinase of death (KOD) are useful for identifying compounds that modulate the biological and/or pharmacological activity of a native mediator of apoptosis, for treating dysfunctional apoptosis conditions, in screening assays to identify agonists which agonise or minic biological and/or pharmacological activity, induce production of or prolong the biological half-life of the molecule in vivo or in vitro The present sequence is a CDNA encoding human KOD protein activator of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                   New human p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B 5
                    The present invention relates to human protein kinase. The proteins are from new human genes termed h12832, h14138, h14833, h1590, h15993, h16341 and h2252. The proteins may be used to identify modulators of their activity. The proteins may also be used to derive products for the treatment of cellular growth related disorders, malignancies, cancers, immune, inflammatory, respiratory, haematological and bone-related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1318

The present sequence encodes a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and scanning agonists of the polypeptide. HRIP and its agonist or antagonist are useful for treating a disease or condition associated with decreased or increased expression of functional HRIP. Diseases treated or disgnosed include neurological disorders such as stroke, Parkinson's disease, demyelinating diseases, bacterial and viral meningitis and other developmental disorders of the central nervous system, other developmental disorders, mysathenia gravis, cell proliferative disorders such as attinic keratosis, arterioscierosis, atherosclerosis and cancer including leukaemia, melanoma, myeloma and cancer of the adrenal gland, inflammatory disorder such as Addison's disease, acquired immunodeficiency diseases, allergies, bronchitis, diabetes mellitus, rheumatoid arthritis, microbial infection and trauma.

CC The present sequence is that of the coding region of cDNA encoding CC rat RIP-3-like-death-associated kinase (RJDAK, see AAB20345), a CC member of the RIP3 family, which is known to be involved in CC apoptosis. The cDNA was obtained from a rat dermal papilla cell CC library. The invention provides RJDAK polypeptides and CC methods of producing a recombinant RJDAK polypeptide, as well as enthodies, a method of designing an RJDAK polypeptide, as well as cof the 3-dimensional structure of a RJDAK polypeptide, a method of cof the 3-dimensional structure of a RJDAK polypeptide, a method of cof the 3-dimensional structure of a RJDAK polypeptide, a method of cof designing an RJDAK polypeptide, a method of cof dentifying compounds that alter RJDAK kinase activity, and for cof dentifying compounds that alter RJDAK kinase activity, and for cof dentifying compounds that alter RJDAK kinase activity, and for cof dentifying compounds that alter RJDAK kinase activity, and for cof dentifying compounds that alter RJDAK polypeptide, a method of cof dentifying compounds that alter RJDAK kinase activity, and for compounds that alter RJDAK infections; cardiovascular disorders such as crown as dispetes, cor as molecular transportations and the compounds that the com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virucide; protozoacide; cardiant; antiinfiammatory; vasotropic; antidiabetic; antitumour; analgesic; immunosuppressive; antithyroid; antiulcer; nephrotropic; cytostatic; nootropic; antionvulsant; hepatotropic; antiallergic; antigout; dermatological; osteopathic; antiarthritic; uropathic; ophthalmological; antipaxhic; antiarthritic; uropathic; pulmonary; hormonal; apoptosis; gene therapy; vaccine; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim

Nucleic acids encoding RJDAK are useful for diagnostic purposes, for expressing recombinant polypeptide for analysis, characterisation or therapeutic use, as markers for tissues in which the corresponding polypeptide is preferentially expressed, to compare with endogenous DNA sequences in patients to identify potential genetic disorders; as an antigen to raise anti-DNA antibodies or elicit another immune response; and for gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I) CC amino acid sequences given in AAM93170 to AAM93921. (I) have cytostatic cc activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased cc expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) CC colynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoletic-derived cells. AAK64703 CC cancers and cancer metastases of haematopoletic-derived cells. AAK64703 CC sequences from the present invention. AAK5492 to AAK64350 and AAM82169 CC represent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel isolated polypeptides (I), and CD polynucleotides (II). (II) and the antibody to (I) are useful for CD diagnosing, preventing and treating diseases including immune system CC disorders (e.g. congenital and acquired immunodeficiencies, autoimmune CC disorders (e.g. rheumatoid arthritis), inflammatory conditions, organ CC transplant rejections and graft versus bost disease, infectious diseases (e.g. hepatitis C), bleeding disorders, heemoglobin abnormalities and CC other blood-related disorders (sickle cell anaemia), myeloproliferative CC disorders (e.g. flammatory conditions), organic conditions (e.g. flammatory disease and cancer), neurodegenerative CC disorders (e.g. flammatory disease and cancer), neurodegenerative CC disorders (e.g. Alzheimer's disease, parkinson's disease), chromosomal CC disorders (e.g. disease), ischaemic injury (e.g. stroke), renal CC disorders (e.g. disease), reproductive system disorders disorders (e.g. disorders) (e.g. arrhythmia), respiratory disorders, dermatological disorders (e.g. disorder) (e.g. arrhythmia), respiratory disorders, dermatological disorders (e.g. disorder (inflammatory disorders), liver disorders, gastrointestinal CC disorder (inflammatory disorders), liver disorders (eightopic colling transported immune deficiency syndrome (AIDS), AAS26976-AAS27850 represent novel signal transduction pathologies e.g. acquired immune deficiency pathway protein coding sequences and PCR primers of the invention.

Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'end of a cDNA provided in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
Human; full length cDNA; cDNA synthesis; oligo-capping;

                                                                                                                                                                                                                                                                                                                                                                                                                                      clones. 830 cDNA molecules encoding a human protein have been clones. 830 cDNA molecules have been determined. Primers for synthesising the full length molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in homology searches to identify the clone. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 665

                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                        CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM9222. (J) have cytostatic cc activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention diagnosis and ctreatment of diseases associated with inappropriate (I) expression. For cc example, they may be used to treat disorders associated with decreased cc expression by rectifying mutations or deletions in a patient's genome ct that affect the activity of (I) by expressing inactive proteins or to cuplement the patients oun production of (I). Additionally, (I) cc supplement the patients oun production of (I). Additionally, (I) cc polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host call and culturing the cell to express the crotain. (I) proteins and polynucleotides may be used to prevent, cancers and cancer metastases of haematopoietic-derived cells. AAK64703 cc cancers and cancer metastases of haematopoietic-derived cells. AAK64703 cc asquences from the present invention. AAK54912 to AAK54950 and AAM82159 cc represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                            The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2890

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Following HAP purification; this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1057416-1061255, and 1144584-1145351). Subtraction by Bento Soares and M. Fatima Bonaldo. **

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKE2); Email s.wiemannédkfz- heidelberg.de;
sequenced by Olagen (Hilden/Germany) within the CDNA sequencing
consortium of the German Genome Project.
No s1 sequence available.
This clone (DKE2)31300939) is available at the RZPD in Berlin.

pcMV-SPORTS; Site_1: NotI; Site_2: ECORV (destroyed); RNA
source anonymous pool of spleen and pancreas from 28 yo
male. Library is oligo-dT primed and directionally cloned
(EcoRV site is destroyed upon cloning). Average insert
size 1.5 kb, insert size range 1-2.5 kb. Library is
normalized and enriched for full-length clones and was
constructed by C. Gruber (Invitrogen). Research Genetics
tracking code 025. Note: this is a NIH_MGC Library.*

(Pharmacla) with a modified polylinker; Site_1: Not I;
Site_2: Eco RI; Equal amounts of plasmid DNA from three
normalized libraries (melanocyte 2NbHM, pregnant uterus
NbHHU, and fetal heart NbHH19W) were mixed, and as circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The driver was PCR amplified CDNAs from pools of
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 300232-265223,

                                                                                                                                                               /note-*Organ: lung_tumor; Vector: pucl8; Site_1: SmaI; Site_2: SmaI; A mini-library was made by clonking products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions.*
